

+ Redefining healing potential

The REGENETEN Bioinductive Implant is an innovative technology designed to address the treatment of rotator cuff disease¹⁻⁵

Smith+Nephew

What is the REGENETEN Bioinductive Implant?

The REGENETEN Bioinductive Implant offers a unique solution that stimulates the body's natural healing response to support new tendon growth and slow down the progression of rotator cuff disease.^{1,2,7-9}

The technology includes a collagen-based bioinductive implant about the size of a postage stamp. This implant is placed through a small incision over the location of your rotator cuff tendon injury. Your physician will secure it in place with small anchors.

The REGENETEN Bioinductive Implant difference

Faster recovery*

Be free of the sling – evidence shows patients treated with the REGENETEN Bioinductive Implant spend less time in a sling and make a quicker return to normal activity²

Patients on average only spend 23 days in a sling following the repair of a partial thickness tear with the REGENETEN Bioinductive Implant.²

Reduced risk*

Early data suggests that it's less likely that the rotator cuff could re-tear after a repair with the REGENETEN Bioinductive Implant^{6,11}

Real life results

The REGENETEN Bioinductive Implant creates an environment that supports the body's natural healing response - not just repair the injury

The new tendon tissue that your body grows is virtually identical to your original tendon in as little as 3 months after the procedure^{1,2,5}

**compared to traditional rotator cuff repair*
